

Clinical Mens Health: Evidence in Practice, 1e

Here's the first evidence-based guide to focus solely on the various health conditions that unequally affect men. This text provides a biopsychosocial approach to diseases and disorders of male patients from birth through infancy, childhood, and adolescence, and from early through late adulthood. Replete with current evidence-based guidelines to facilitate clinical decision-making, the framework of each chapter builds upon epidemiological data centered on men. Special attention is given to the circumstances that influence men to either seek or not seek routine medical care. Provides a general overview of the construct of mens health, detailing the organization of preventive healthcare in men, diagnostic bias in mens healthcare, gender disparities on a global level, and the hesitancy of men to seek help. Focuses on pertinent medical disorders and biopsychosocial issues in the developing male from infancy through school-age to adolescence. Highlights a comprehensive review of common system-based disease conditions that unequally impact adult men through an evidence-based approach. Examines special concerns of adolescent and adult males including lifestyle risks, suicide, nutrition, stress, exercise and fitness, integrative medicine, cosmetic plastic surgery, cancer, and end of life issues. Summarizes clinical care guidelines for special populations of men including athletes, executives, prisoners, homosexuals, and transgendered men. Authored by leaders from numerous subspecialties, for well-rounded perspectives on many clinical problems.
