

This book contains the proceedings of the ARW NATO conference on Lipid Mediators in Immunology of Burn and Sepsis held in Helsingor, Denmark, July 20-25, 1986. This meeting brought together some of the most distinguished researchers in the fields of thermal injury, the immune system and lipid mediator biochemistry. It is well known that there is a substantial impairment of the immune response during sepsis, burn, trauma and other kinds of shock. These conditions are characterized by a massive inflammatory process which occurs during the early phase following injury. Among the various mediators released at this time are leukotrienes, thromboxane, histamine and platelet-activating factor. This latter autocooid possesses potent proinflammatory properties and together with the other mediators may account for some of the post-injury pathophysiological phenomena such as extravasation, hypotension, chemotaxis... It is of great interest to note that recently leukotrienes and platelet-activating factor have been shown to be potent mediators of the immune response. Thus, the purpose of this meeting was to bring together clinicians, immunologists and biochemists in order to examine and hopefully clarify the putative role of various lipid mediators prominent in the early stages after injury. This book is divided into the following six sections. Section 1 provides a general overview of the physiological consequences of burn, sepsis and shock.
